REPUBLIC OF LEBANON MINISTRY OF PUBLIC HEALTH

Lebanon Clinical Trials Registry

Key inclusion and exclusion criteria: Inclusion criteria

1. Prior to any screening procedures are performed, written informed consent/assent must be provided.

Male and female patient aged ≥ 2 years 3. Exjade naïve patient or chelated naive patient or treated by other chelators for at least 6 months, such as: a. Deferiprone/ DFP b. Deferoxamine /DFO c. Combination (DFO + DFP)

4. Subject is willing to discontinue current iron chelation therapy at least 7 days prior to the first day and for the duration of the study

5. Patients with transfusion-dependent thalassemia (independent of underlying condition) with transfusional iron overload as shown by: -a

serum ferritin level of > 1000 ng/ml at screening and if available, LIC > 3 mg Fe/g dw until 6 months prior to screening

6. Patients with non-transfusion-dependent thalassemia with iron overload as shown by: -a serum ferritin level of ≥ 800 ng/ml at screening and if available, LIC \geq 5 mg Fe/g dw until 6 months prior to screening

Key inclusion and exclusion criteria: Gender

Key inclusion and exclusion criteria: Specify gender

Both

2

Key inclusion and exclusion criteria: Age minimum

Key inclusion and exclusion criteria: Age maximum 99

Key inclusion and exclusion criteria: Exclusion criteria

1. Male and female patient aged < 2 years

2. Written consent/assent from patients/parents/legal representative is not obtained

3. Creatinine clearance below the contraindication limit in the locally approved prescribing information.

4. Serum creatinine level > 1.5 x ULN (upper limit of normal)

5. AST (SGOT) /ALT (SGPT) > 5 x ULN, unless if LIC confirmed as <10 mg Fe/dw within 6 months prior to screening visit.

6. Significant proteinuria as indicated by a urinary protein/creatinine ratio > 0.5 mg/mg in a non-first void urine sample.

7. Patients with significant impaired gastrointestinal (GI) function or GI disease that may significantly alter the absorption of oral defension (e.g. ulcerative diseases, uncontrolled nausea, vomiting, diarrhea, malabsorption syndrome, or small bowel resection).

8. Clinical or laboratory evidence of active Hepatitis B or Hepatitis C (HBsAg in the absence of HBsAb OR HCV Ab positive with HCV RNA positive).

9. Patients with psychiatric or addictive disorders which prevent them from giving their informed consent or undergoing any of the treatment options or patients unwilling or unable to comply with the protocol (including use of electronic devices for ePRO).

10. Patients with a known history of HIV seropositivity (Elisa or Western blot).

11. History of malignancy of any organ system, treated or untreated, within the past 5 years whether or not there is evidence of local recurrence

or metastases, with the exception of localized basal cell carcinoma of the skin. 12. Patients participating in another clinical trial or receiving an investigational drug.

13. History of hypersensitivity to any of the study drug or excipients.

14. Significant medical condition interfering with the ability to partake in this study (e.g. systemic uncontrolled hypertension, unstable cardiac disease not controlled by standard medical therapy, systemic disease (cardiovascular, renal, hepatic, etc.).

15. Women of child-bearing potential, defined as all women physiologically capable of becoming pregnant, unless they are using effective methods of contraception during dosing of study treatment

16. Women are considered post-menopausal and not of child bearing potential if they have had 12 months of natural (spontaneous) amenorrhea with an appropriate clinical profile (e.g. age appropriate, history of vasomotor symptoms) or have had surgical bilateral oophorectomy (with or without hysterectomy) or tubal ligation at least six weeks ago. In the case of oophorectomy alone, only when the reproductive status of the woman has been confirmed by follow up hormone level assessment is she considered not of child bearing potential. 17. Sexually active males unless they use a condom during intercourse while taking drug and for 28 days after stopping study medication and should not father a child in this period. A condom is required to be used also by vasectomized men in order to prevent delivery of the drug via seminal fluid.
