Acronym

STELLA

Acronym

STELLA

This is a multicenter, multinational, double-blind, 1:1 randomized, parallel-group, equivalence Phase 3 study to compare the efficacy and safety of MB02 versus Avastin® in subjects with Stage IIIB/IV non-squamous NSCLC in combination with Carboplatin and Paclitaxel.

MB02/Avastin® plus chemotherapy will be repeated every 21 days for 6 cycles. After 6 cycles, subjects can continue to receive MB02/Avastin® monotherapy treatment every 3 weeks. Patients will stay on treatment until evidence of disease progression, intolerance or until unacceptable toxic effects develop. The study ends at Week 52; no further study assessments will be made after this time.

Brief summary of the study: Arabic

Health conditions/problem studied: Specify

Stage IIIB/IV Non-squamous Non-Small Cell Lung Cancer

Interventions: Specify

Cycle 1 through Cycle 6 (Monoclonal Immnuglobulin therapy in combination with chemotherapy administered on Day 1 of every 3 week treatment cycle)

- Arm 1:

MB02 (bevacizumab biosimilar) IV at an intended dose of 15 mg/ kg

Paclitaxel IV at an intended dose of 200 mg/ m2

Carboplatin IV to achieve and AUC 6

- Arm 2:

Avastin (bevacizumab) IV at an intended dose of 15 mg/ kg

Paclitaxel IV at an intended dose of 200 mg/ m2

Carboplatin IV to achieve and AUC 6

From Cycle 7 onwards (Monoclonal Immnuglobulin monotherapy):

Arm 1: MB02 (bevacizumab biosimilar) IV at an intended dose of 15 mg/kg

- Arm 2: Avastin (bevacizumab) IV at an intended dose of 15 mg/ kg

Key inclusion and exclusion criteria: Inclusion criteria

Inclusion Criteria

To be eligible for study entry, subjects must satisfy all of the following criteria:

- 1. Males and female subjects aged ≥ 18 years to ≤ 80 years.
- 2. Signed informed consent must be obtained before initiation of any study-specific procedures or treatment as confirmation of the subject's awareness and willingness to comply with the study requirements.
- 3. Subjects should have newly diagnosed or recurrent Stage IIIB/IV (defined by seventh edition of the TNM classification for Lung Cancer, 2010) non-squamous NSCLC not amenable to curative intent surgery, and not have received any systemic therapy for advanced disease (exclusion criteria 3 and 4). For subjects with recurrent disease, at least 6 months must have elapsed before randomization from previous adjuvant treatment.
- 4. Previous radiation therapy if completed >4 weeks before randomization. Palliative radiotherapy to bone lesions is allowed if completed >2 weeks of randomization.
- 5. Subjects must have at least 1 unidimensional measurable lesion per RECIST version 1.1 (assessed locally).
- 6. Subjects must have an ECOG performance status ≤1 at Screening.
- 7. Subjects must have adequate hepatic, renal and hematologic function defined as:
- ☐ Hepatic function: bilirubin level <1.5 ULN, ALT and AST levels<2.5×ULN.
- □ Renal function: serum creatinine level <1.5×ULN, calculated creatinine clearance (CrCl) >30 mL/min (Cockroft-Gault formula), urine protein to creatinine ratio <1. Subjects with urine protein-to-creatinine ratio >1 may be enrolled if they have <1 g of protein in 24-hour urine collection.
- ☐ Hematological function: Absolute neutrophil count >1.5×109 /L; platelets >100×109 /L, hemoglobin (Hb) >9 g/dL.
- □ Adequate coagulation parameters such as: INR ≤ 2.0 and aPTT ≤ 1.5 x ULN within 7 days prior to randomization for patients not receiving anticoagulation therapy.
- 8. Eligible subjects must have a systolic blood pressure of ≤ 140 mm Hg and a diastolic blood pressure of < 100 mm Hg at screening.

9. Women of childbearing potential, and their partners, must agree to adhere to pregnancy prevention methods throughout the duration of the study (including the Follow-up visits, where applicable). Women of childbearing potential are defined as those who are not surgically sterile (did not underwent bilateral tubal ligation, bilateral oophorectomy, or hysterectomy) and not postmenopausal. Subjects and their partners must agree to use a highly effective method of contraception, to avoid women becoming pregnant throughout the course of the study. Medically acceptable forms of birth control can include the following, with approval of the treating physician:

-Combined (estrogen and progestogen containing) hormonal contraception associated with inhibition of ovulation (oral, intravaginal, or transdermal), progestogen-only hormonal contraception associated with inhibition of ovulation (oral, injectable, implantable), intrauterine device, intrauterine

hormone-releasing system, bilateral tubal occlusion, vasectomised partner, sexual abstinence.

- 10. Non fertile women can be included, that is, those who are physiologically incapable of becoming pregnant, because of:
- ☐ Bilateral oophorectomy (ovariectomy).
- □ Bilateral tubal ligation or,
- ☐ Postmenopausal women defined as:

Subjects not using HRT and have experienced total cessation of menses for 1 year and be greater than 45 years of age, OR, in questionable cases, have a follicle stimulating hormone >40 mIU/mL and an estradiol value <40 pg/mL (<140 pmol/L).

Subjects must discontinue HRT before study enrolment because of the potential for inhibition of cytochrome enzymes that metabolize estrogens and progestins. For most forms of HRT, at least 2 to 4 weeks must elapse between the cessation of HRT and determination of menopausal status; the length of this interval depends on the type and dosage of HRT.

If a female subject is determined not to be postmenopausal, that subject must use adequate contraception, as defined immediately above (inclusion 8).

Key inclusion and exclusion criteria: Gender Key inclusion and exclusion criteria: Specify gender

Both

Key inclusion and exclusion criteria: Age minimum Key inclusion and exclusion criteria: Age maximum

80

Key inclusion and exclusion criteria: Exclusion criteria

Exclusion Criteria

Subjects will be excluded from the study if 1 or more of the following criteria are applicable:

- 1. Inability to comply with protocol procedures.
- 2. Participation in another clinical trial or treatment with another investigational agent within 4 weeks or 5 half-lives of investigational agent before

randomization, whichever is longer.

- 3. Subjects previously treated with monoclonal antibodies or small molecule inhibitors against VEGF or VEGF receptors, including Avastin®.
- 4. Subjects who have received previous chemotherapy, immunotherapy, targeted therapy, or biological therapy for their lung cancer. Note: Adjuvant and neoadjuvant therapy are permitted (see: inclusion criterion 3).
- 5. Subjects who have known central nervous system disease, with the exception of subjects with treated brain metastases who have completed treatment (radiation, surgery or stereotactic surgery) and have not received steroids for at least 4 weeks before randomization. Subjects with central nervous system metastases treated by neurosurgical resection or brain biopsy performed within 8 weeks before randomization will be excluded. Subjects with known or history of brain metastases must undergo brain imaging during screening.
- 6. Current or recent (within 10 days of the first dose of study treatment) use of aspirin (at least 325 mg/day) or other nonsteroidal antiinflammatory drugs with antiplatelet activity or treatment with dipyridamole (Persantine®), ticlopidine (Ticlid®), clopidogrel (Plavix®), or cilostazol (Pletal®).
- 7. Current or recent (within 5 days) use of therapeutic anticoagulation or use of thrombolytic agent. Prophylactic use of low molecular weight heparin is allowed.
- 8. Subjects with an INR >2, unless receiving active anticoagulation treatment, will be excluded.
- 9. Subjects who have a diagnosis of small cell carcinoma of the lung or squamous cell carcinoma of the lung. Mixed tumors should be categorized according to the predominant histology. If small cell elements are present, the subject will be excluded.
- 10. Subjects with known tumors that harbor activating epidermal growth factor receptor and anaplastic lymphoma receptor tyrosine kinase (assessed locally).
- 11. Subjects who have a history of hypersensitivity to the active substance (bevacizumab, carboplatin, and/or paclitaxel) or any of the excipients (such as trehalose dehydrate, sodium phosphate, or polysorbate 20).
- 12. Subjects with known active viral infection: hepatitis B, hepatitis C, or HIV.
- 13. Subjects who are pregnant or breastfeeding. Women of child-bearing potential must have a negative pregnancy test at Screening.
- 14. Subjects with previous major surgery, open biopsy, open pleurodesis, or significant traumatic injury within 4 weeks before randomization or those

anticipated to require major surgery during the study.

- 15. Subjects who have had a core biopsy taken or have had another minor surgical procedure, excluding placement of vascular access device, closed pleurodesis, thoracentesis, and mediastinoscopy, within 1 week of randomization.
- 16. Subjects with a history of abdominal fistula, GI perforation, intra-abdominal abscess within 6 months of randomization.
- 17. Subjects with a nonhealing wound, active ulcer, or untreated bone fracture.
- 18. Subjects with previous history of hypertensive crisis or hypertensive encephalopathy.
- 19. Subjects with New York Heart Association Grade II or greater congestive heart failure, or angina, myocardial infarction within 6 months before randomization; symptomatic arrhythmia or serious cardiac arrhythmia requiring medication; abnormal left ventricular ejection fraction < 50% assessed by ultrasound or multigated acquisition scan.
- 20. Subjects with a previous malignancy within 3 years of randomization (other than superficial basal cell and superficial squamous (skin) cell carcinoma, or carcinoma in situ of the uterine cervix, bladder, or prostate).
- 21. Subjects with history of a significant vascular event within 6 months before randomization (including, but not limited to myocardial infarction and stroke or transient ischemic attack).

- 22. Subjects with known bleeding diathesis or significant coagulopathy within 3 months before randomization.
- 23. Subjects with history of grade ≥2 hemoptysis within 6 months before randomization (≥0.5 teaspoons of bright red blood per event).
- 24. Subjects with a tumor(s) invading or compressing major blood vessels.
