Phase III Study of Efficacy and Safety of Secukinumab Versus Placebo, in Combination With Glucocorticoid Taper Regimen, in	
Patients With Polymyalgia Rheumatica (PMR)	
Scientific title	Acronym
A Randomized, Parallel-group, Double-blind, Placebo-controlled,	
Multicenter Phase III Trial to Evaluate Efficacy and Safety of Secukinumab Administered Subcutaneously Versus Placebo, in	
Combination With a Glucocorticoid Taper Regimen, in Patients With Polymyalgia Rheumatica (PMR)	
Brief summary of the study: English	
The purpose of this study is to demonstrate the efficacy and safety of secukinumab 300 milligram (mg) and 150 mg administered	
subcutaneously (s.c.) for 52 weeks in combination with prednisone tapered over 24 weeks in adult participants with PMR who have	
recently relapsed	
Brief summary of the study: Arabic

Interventions: Specify	
Drug: Secukinumab 300 mg Taken subcutaneously every 4 weeks until Week 48 in combination with a	24-week prednisone taper regimen

Other Name: AIN457 Drug: Secukinumab 150 mg Taken subcutaneously every 4 weeks until Week 48 in combination with a 24-week prednisone taper regimen Other Name: AIN457 Other: Placebo to secukinumab Taken subcutaneously every 4 weeks until Week 48 in combination with a 24-week prednisone taper regimen

### Key inclusion and exclusion criteria: Inclusion criteria

Inclusion Criteria:

1- Signed informed consent must be obtained prior to participation in the study

2- Male or non-pregnant, non-lactating female participants at least 50 years of age.

3- Diagnosis of PMR according to the provisional American College of Rheumatology (ACR)/European League Against Rheumatism (EULAR) classification criteria: Participants  $\geq$  50 years of age with a history of bilateral shoulder pain accompanied by elevated C-reactive protein (CRP) concentration ( $\geq$  10 mg/L) and/or elevated erythrocyte sedimentation rate (ESR) ( $\geq$  30 mm/hr) who scored at least 4 points from the following optional classification criteria:

Morning stiffness > 45 minutes (min) (2 points)

Hip pain or restricted range of motion (1 point)

Absence of rheumatoid factor and/or anti-citrullinated protein antibodies (2 points)

Absence of other joint involvement (1 point)

4- Participants must have a history of being treated for at least 8 consecutive weeks with prednisone (≥ 10 mg/day or equivalent) at any time prior to screening

5- Participants must have had at least one episode of PMR relapse while attempting to taper prednisone at a dose that is ≥ 5 mg/day (or equivalent) within the past 12 weeks prior to BSL. Diagnosis of a PMR relapse is defined as participant meeting both of the following:

Recurrence of bilateral shoulder girdle and/or bilateral hip girdle pain associated with inflammatory stiffness with or without additional symptoms indicative of PMR relapse (such as constitutional symptoms) within 12 weeks prior to BSL that are in the opinion of the Investigator not due to other diseases that may mimic PMR such as osteoarthritis in shoulders or hips, polyarticular calcium pyrophosphate deposition disease, rotator cuff disease, adhesive capsulitis (frozen shoulder) or fibromyalgia.

Elevated ESR ( $\geq$  30 mm/hr) and/or elevated CRP (> upper limit of normal (ULN)) attributable to PMR at the time of relapse and/or at screening 6- Participants must have been treated as per local treatment recommendations following the latest PMR relapse and must be on prednisone of at least 7.5 mg/day (or equivalent) and not exceeding 25 mg/day at screening and during the screening period

Other protocol-defined inclusion/exclusion criteria may apply

Key inclusion and exclusion criteria: Gender	Key inclusion and exclusion criteria: Specify gender
Both	
Key inclusion and exclusion criteria: Age minimum	Key inclusion and exclusion criteria: Age maximum

### Key inclusion and exclusion criteria: Exclusion criteria

Exclusion Criteria:

Type of study

1- Evidence of GCA as indicated by typical (cranial) symptoms (e.g., persistent or recurrent localized headache, temporal artery or scalp tenderness, jaw claudication, blurry or loss of vision, symptoms of stroke), extremity claudication, imaging and/or temporal artery biopsy result 2- Concurrent rheumatoid arthritis or other inflammatory arthritis or other connective tissue diseases, such as but not limited to systemic lupus erythematosus, systemic sclerosis, vasculitis, mixed connective tissue disease, and ankylosing spondylitis

Concurrent diagnosis or history of neuropathic muscular diseases

Inadequately treated hypothyroidism (e.g., persistence of symptoms, lack of normalization of serum TSH despite regular hormonal replacement treatment)

4- Previous exposure to secukinumab or other biologic drug directly targeting IL-17 or IL-17 receptor

5- Participants treated with tocilizumab or other IL-6/IL6-receptor inhibitors within 12 weeks or within 5 half-lives (whichever is longer) prior to BSL; participant who did not respond to or experienced a relapse during treatment are excluded from enrollment into the study

# Lebanon Clinical Trials Registry

Primary Outcomes				
Name	Time Points	Measure		
Proportion of patients achieving complete sustained remission	Time Frame: 52 Weeks	Sustained remission at Week 52 is defined as a participant meeting all of the following: • achieved remission at Week 12 AND all of the following, sustained from Week 12 to Week 52: no recurrence of signs or symptoms, attributable to PMR, that requires escape treatment or rescue treatment no new diagnosis of Giant cell arteritis (GCA), that requires escape treatment or rescue treatment Remission at Week 12 is defined as a participant meeting all of the following at Week 12: no use of escape treatment or rescue treatment prior to Week 12 no signs or symptoms attributable to PMR, that requires escape treatment or use of rescue treatment, at Week 12 no new diagnosis of GCA, that requires escape treatment or rescue treatment, at Week 12		

Key Secondary Outcomes		
Name	Time Points	Measure
Proportion of patients achieving complete sustained remission	Time Frame: 52 Weeks	Complete sustained remission at Week 52 is defined as participant meeting all of the following: achieved sustained remission no clinically relevant elevation of Erythrocyte sedimentation Rate (ESR) and/or C- reactive protein (CRP) at ≥2 consecutive scheduled visits from Week 12 to Week 52
Adjusted annual cumulative glucocorticoid (GC) dose adjusted by duration of study follow-up	Time Frame: 52 Weeks	Adjusted annual cumulative GC dose is cumulative GC dose through Week 52 adjusted by duration of study follow-up
Time to first use of escape treatment or rescue treatment as measured in days	Time Frame: 52 Weeks	First use of escape treatment or rescue treatment is defined as the first time when the escape treatment or rescue treatment is used
Change in FACIT-Fatigue Score	Time Frame: 52 Weeks	The Functional Assessment of Chronic Illness Therapy - Fatigue (FACIT-Fatigue) is a 13-item questionnaire that assesses self-reported fatigue and its impact upon daily activities and function. The purpose of collecting available FACIT-Fatigue data is to assess the impact of fatigue on participants with PMR
Change in HAQ-DI score	Time Frame: 52 Weeks	The Health Assessment Questionnaire - Disability Index (HAQ-DI) is used to assess the long-term influence of chronic disease on a participant's level of functional ability and activity restriction. The purpose of the HAQ-DI is to assess the functional ability of subjects with PMR
